

# Medical Supplies Catalogue

edition 2013

# Preface

The charitable, non-governmental organization action medeor e.V. is the largest medical aid organization in Europe. Together with local partners, medeor provides medicines and medical equipment to around 10,000 healthcare centres in 140 countries.

Sustainable assistance is a particular concern to medeor. Therefore, we cooperate with local partners, who receive medicines and medical products, distributing the goods as agreed and implement the necessary long-term help.

Relief organizations, local initiatives and health facilities are able to receive effective medication and medical equipment for a reliable medical care. The goods are provided if necessary with the help of donations and if possible at cost price.

## The pillars of medeor-support

- medeor provides emergency aid and disaster relief to help people in situations of crisis with the best possible medical care.
- medeor supports its local partners to carry out their own medical projects to build up a solid healthcare.
- medeor advises on pharmaceutical and medical questions to ensure the quality of locally produced medical products and improves the appropriate dealing with diseases.
- medeor supports the creation and development of local structures for the production of medicines so that people in developing countries can use independent and self-determined affordable medicines.
- medeor actively combats the worldwide most dangerous infectious diseases: malaria, tuberculosis and HIV/aids.

Many national and international aid organizations appreciate medeor as a competent supplier of high quality medicines and medical equipment.

In the head office in Tönisvorst, medeor stores more than 300,000 medicine containers on 4,000 m<sup>2</sup> storage space. All of these containers are ready for dispatch within a short space of time – also to remote and difficult accessible places.

 Hemo Control

Hemo Control System enables quick and exact determination of blood haemoglobin- and haematokrit concentration. It consists of a small photometer that evaluates with dry reagents filled micro-cuvettes and which is to be used both, via internal, rechargeable accus and via mains connection.

The micro-cuvette takes directly a small venous, arterial or capillary blood test and then is put-in into the hemo control photometer. After a short measuring time, haemoglobin value is indicated, upon request also with hematocrit and other measuring sizes, border areas, etc.

Hemo control systems are reliable and are working all over the world.
